Yes, that's right. Some **FISH** can **FLY**. I didn't believe it either until I saw it with my own eyes. To get away from predators, they jump out of the water and let their wing-like fins carry them on air currents.

SHARKS are dangerous. Don't do what I'm doing in this picture (I made friends with this one first which is why it's OK).

HAMMERHEAD SHARKS get their name because of the shape of their head. The eyes at each end give them all-round vision.

The largest snake in the Belize Jungle, the **BOA CONSTRICTOR** can reach an amazing length of 5 metres from head to tail. Sometimes it's hard to see where it begins and ends, or which end belongs to which head.

CHAMELEONS are very sneaky. Their eyes can move separately from each other, so they can look for their dinner in two different directions.

We saw this **LEOPARD** prowling through the grass when we were in the jungle. Leopards are so strong they can haul their prey up into trees when they've killed it. It's lucky we made friends with this one!
