Oviraptor

I eat cones, shellfish and nuts –
cracking eggs can be tasty too.
Best of all, a fat crunchy beetle,
snatched from the top
of a dinosaur poo.

Oviraptor

(Oh-vee-rap-tor)

- Lived 85 – 75 million years ago
- Nose to tail: 1.8 metres
- Omnivore

Oviraptor stood on two legs and was a fast emu-sized dinosaur.

Nobody is sure what *Oviraptor* ate but it was probably omnivorous, eating both plants and meat.

Using its strong beak, it could easily have crushed nuts, bones, insects, eggs and shellfish.
