Nature detectives

If you've ever found some mysterious animal tracks in the snow or noticed a footprint in a patch of mud and wondered what made it, then this is the book for you. Wild creatures leave a trail of clues wherever they go. This might be the remains of a meal, a hole in the ground, a tuft of fur or perhaps a pile of droppings. With the help of this book you can learn to read these signs, spot other clues and become a skilled nature detective who can track all kinds of wildlife.

Along the way, you will learn a lot about animals, from tiny caterpillars to huge, clomping African mammals. You'll be able to spot signs of birds, insects, reptiles and many other kinds of creatures too and, maybe best of all, you can have fun doing it. So, put on your shoes, grab a camera, head outside and find that pool

THE RULES OF TRACKING

- Don't disturb any living creature or its home, for example do not touch birds' nests or eggs.
- 2 Avoid using bare hands to touch things which might be covered in unwanted bacteria such as poo, pellets, animal remains and feathers.
- 3 When collecting items use gloves, tweezers or a polythene bag turned inside out.
- Take extra care where there may be dangerous animals about: always go with an experienced, trusted adult.
- Only track animals in places where you have permission to go.

A tracker's tools

A sharp pair of eyes is the most important thing you'll need when tracking signs of animals, but it might also help to take along these:

Small backpack

To keep everything in so that your hands are free. Also useful for keeping your pickled pumpkin sandwiches dry!

Camera or phone

There are often clues or tracks that you can't identify on the spot. Taking photos gives you the chance to keep a record of something so you can research it later.

Notebook and pencil

With these two low-tech wonders, you can sketch, take notes, record the size of things and jot down important facts such as where and when you saw something. Notes are also fun to look back on.

Small polythene bags

The self-seal ones are particularly good for all those things you'll want to collect: owl pellets, nibbled nut shells, rare feathers or a moose skeleton (good luck finding a bag that big).

Tape measure or ruler

If you discover a very exciting animal footprint you can't take it with you, but you can measure it to help find out which creature left it. You can also take a photo of the clue with the ruler next to it for scale.

Small magnifying lens

There's no need to haul around a hefty Sherlock Holmes-style magnifying glass. You can get a small but powerful folding lens quite cheaply which will help you to see vital details.

Great for peering into burrows or holes in tree stumps. Also useful if it gets dark!

Tweezers

Use these to pick up small items that you don't want to touch with bare hands.

Vital for poking things! If you come across the body of an animal and want to look for signs of a predator then you need a strong stick. No need to buy one – pick one up in the woods,

Binoculars

Not essential, but helpful for looking at birds, fleeing animals and, well, anything interesting in the distance.

Survival stuff

It's probably best to have all of this too:

- Water
- · Snack
- · Tissues or wet wipes
- Coat, hat or wellies if it's cold, wet or muddy.

THINGS NOT TO TAKE

A beach ball
A ladder
A noisy little brother or sister
A piano
A herd of wildebeest

Poo is good if you are searching for signs of animals. All creatures produce waste and what they leave behind can help us to identify them – poo is a clue! Okay, sometimes it's smelly and covered in flies but many animal droppings don't pong much at all, and it's amazing what you can learn from them.

What is poo? Poo is made up of the

Poo is made up of the parts of food that the animal can't digest such as bone, fur, feathers and hard seed cases.

8HINO 50-90 cm

WILD BOAR 7-8 cm

BIG poos

If you want to be a top tracker of animals and know what kind of wildlife is around then you need to be able to distinguish doo-doo! Here are some poo pointers plus some amazing facts about huge stools (and I don't mean those high chairs you sit on at breakfast!).

to become a mini doo-doo detective! Poodunnit?

Spotty windows

Little dark spots on and around windows in your home are probably tiny fly or spider poos. They are often seen in the corners.

Smaller animals tend to leave little

piles of compact, grain-like poos

rather than single squashy plops.

Telling whose poo is whose is not

easy, though. This page will help you

Pencil lead in your shed?

This is a sign that you probably have house mice visiting. They leave piles of small dark cylinders like rice grains, about 6 mm long and 2 mm thick.

- . Elephants poo about 70 kg a day (that's as heavy as a grown man).
- · Giraffe poo falls a long way but it's made up of tiny pellets (so watch where you're standing!).
- · Blue whales can leave a plume of poo in the ocean up to 20 m long - be careful where you swim!
- . In 2014 a one-metre-long dinosaur poo was sold at an auction, although some scientists argue that this wasn't really a plop at all.
- · Scientists have calculated that the largest dinosaur. Argentinosaurus, did about 15 litres of poo at a time.

Pea-pellet poo piles

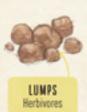

Rabbits leave scattered piles of centimetre-sized ball-shaped droppings all over grassy areas in the countryside.

Types of turd

Here are the main sorts of mammal poo. But beware, it's easy to confuse poos!

MORE MINI POOS

* hare poos: 13-15 mm

* Wood mouse poos: 5-6 mm

* Shrew poos: 2-4 mm

* Vole poos: 6-7 mm

A loo in your loft?

Heaps of small, dark crumby pellets in a roof space may be the sign of bats.
